TOPICAL ISSUES MANAGEMENT FEATURES OF THE AGRARIAN PRODUCTION STRUCTURE

Agroindustry has a number of features that are to some extent reflected in the final economic results of agricultural production structures and therefore should be taken into account when designing and implementing control systems. Managers, farmers take management decisions that have a discrete character that increases the responsibility for their development and implementation. This is due to multivariable and production plans, increases the level of uncertainty in the design, and most importantly, in their implementation. Account of such features of Agriculture allows drawing conclusions about the possibility of specifying the laws and principles of the formation of a common methodology, which will be based on the effective organizational and economic management activities agricultural production structures.

Keywords: management, agricultural production structures, agricultural production, managers, farmers, administrative decisions.
